Public Health 1. Antibiotic Resistant Bacteria

- 8 million pigs in NC (10M people)
- > \$6 billion annually
- **Antibiotics fed to promote pig growth**

- Many **antibiotic resistant bacteria** in the cockroach **gut**
- Antibiotic resistance profiles are **identical** in bacteria from **pig feces** and **cockroach feces** (few antibiotic resistant bacteria in cockroaches from homes in Raleigh, NC)
- **Cockroaches as potential vectors of pathogenic & antibiotic resistant bacteria!**

Public Health 2. Allergens & Asthma

Asthma: An old... but surging pulmonary disease

- Long-term lung disease that inflames and narrows the airways
- Induced by exposure to an allergen

- 24.6 M Americans have **asthma**
– > **7 million children**
- \$82 **b**illion annual costs
- 1.75 M emergency room visits

Infested

Uninfested

Infested

- Settled floor dust of cockroach-**infested homes** contains hundreds of significantly elevated chemicals compared to **uninfested homes**
- Compounds of concern for human health:
 - Pesticides, **mycotoxins**

Danger of Cockroach Feces: Microbial contaminants

Gram-negative Bacteria Produce

Endotoxins

- Pyrogenic
- Respiratory track inflammation

Cockroach gut has a large community of Gram-negative bacteria

Do cockroaches defecate endotoxins into homes?

Public health

IPM

Conclusions

- Cockroaches defecate large amounts of endotoxins
- Females eat more and defecate more endotoxins than males
- More **endotoxins** in **Infested** than **Uninfested** homes
- More **endotoxins** in **Kitchens**, where there are more cockroaches

Association of Emerging Biocontaminants with Cockroaches

- Mycotoxins (fungal toxins) in household dust
- Significantly elevated levels in **infested homes**
- **Ongoing:**
 - Do cockroaches have any role in the accumulation of these mycotoxins?
 - Do these metabolites interact with allergens to affect asthma?

Public Health: Recap

Cockroaches

- Carry and disseminate **pathogenic microbes**, including **antibiotic resistant bacteria**;
- Produce potent **allergens** that trigger asthma, especially in sensitized children;
- Produce potent **endotoxins** and other **microbial toxins** that increase the allergic and asthmatic responses.

“Practical IPM”: Intervention design

Recruitment:
NCSU IRB (Institutional
Review Board approval) –
Human subjects research

Intervention:
• **Baits only**

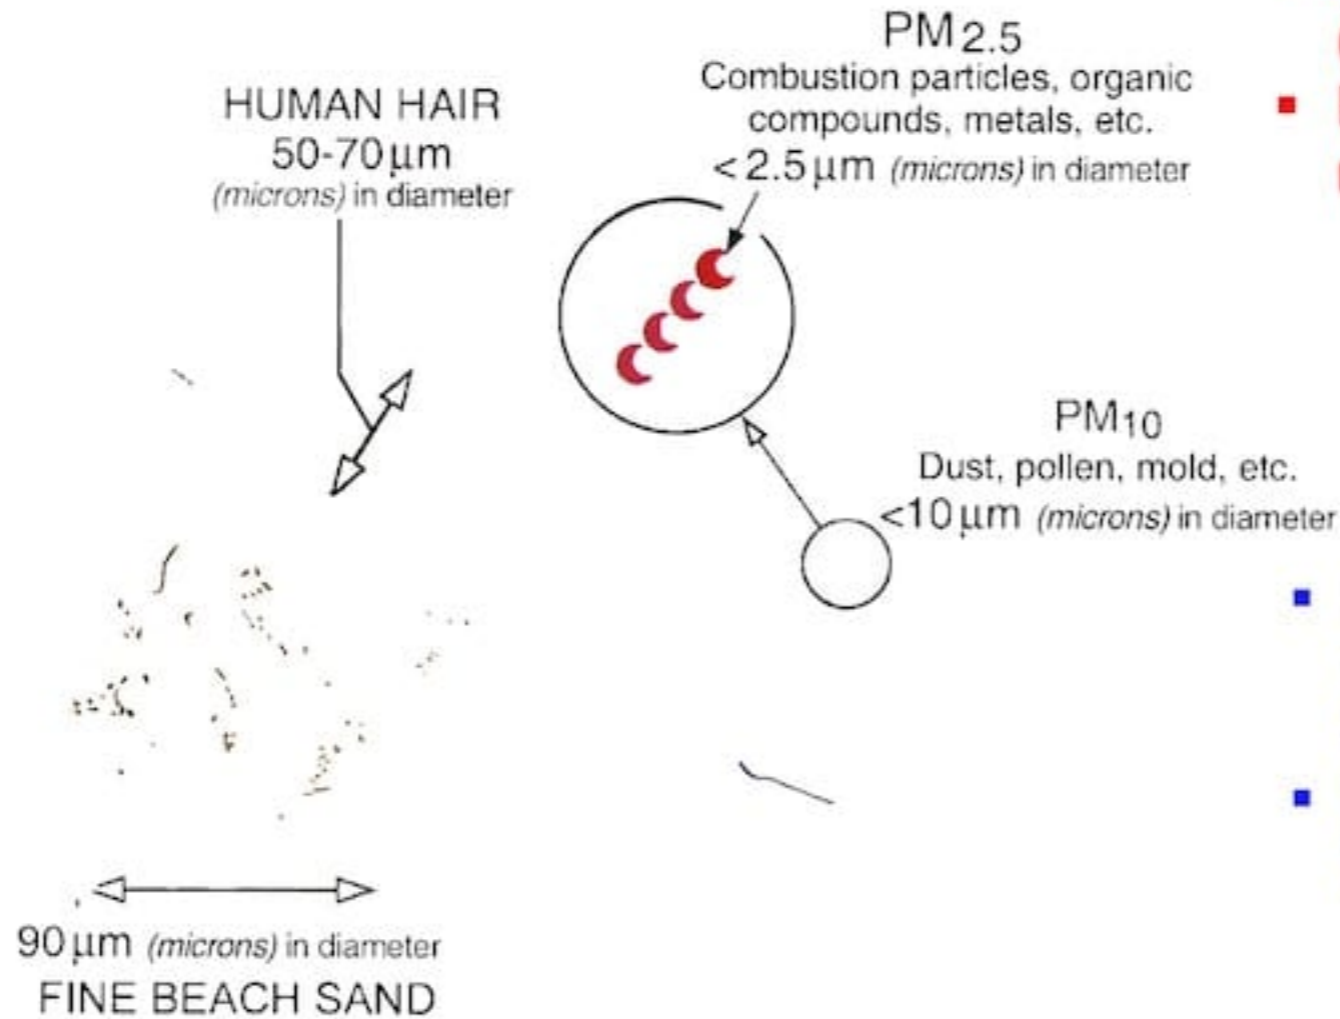

Collect dust (allergens)

Monitoring-based

Trap:
Estimate infestation size

- Organic compounds (metabolites)
- Pesticides, bacterial toxins, mycotoxins

- Allergens are released into the environment through feces, molts and body fluids
- Degrade and become part of inhalable dust

“Practical IPM”: Intervention design

**Quantify
allergens**

Bla g ELISA

**Quantify
cockroaches**

kitchen
living room
bedroom

Danger of Cockroach Allergens

- 1 fecal pellet = 52 μg of allergen (Bla g 1)
- 1 female = ~ 156 μg of allergen (Bla g 1) per day!
- Human Sensitization Threshold = **0.28 $\mu\text{g/g}$ dust**

Does controlling cockroaches mitigate allergens in infested homes?

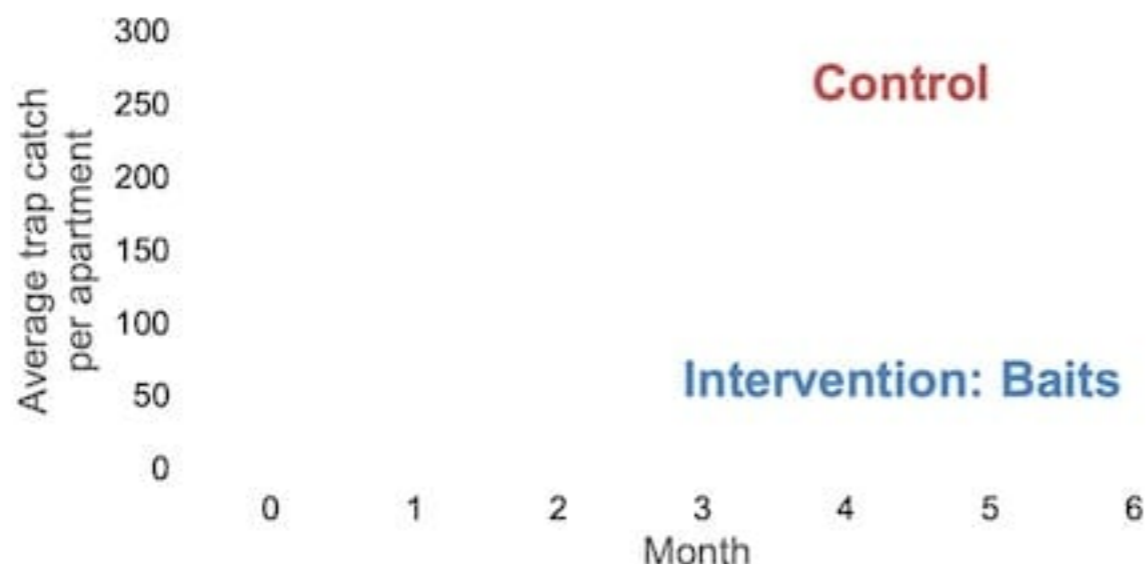

"Upside-Down" IPM: Baits **ONLY**

Public health

IPM

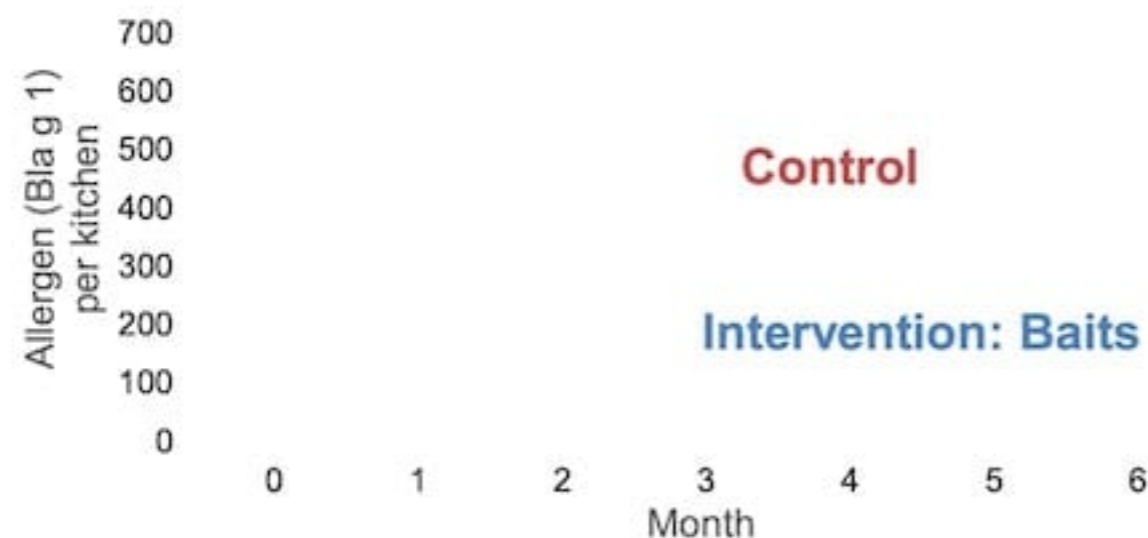

Baits

Conclusions

Cockroach control: Baits only

- no change in untreated control homes
- >97% reduction in treated homes
- elimination in 9 of 16 homes

Allergen reduction: Baits only

- no change in untreated control homes
- >97% allergen reduction in treated homes
- several homes below clinical thresholds

Public health

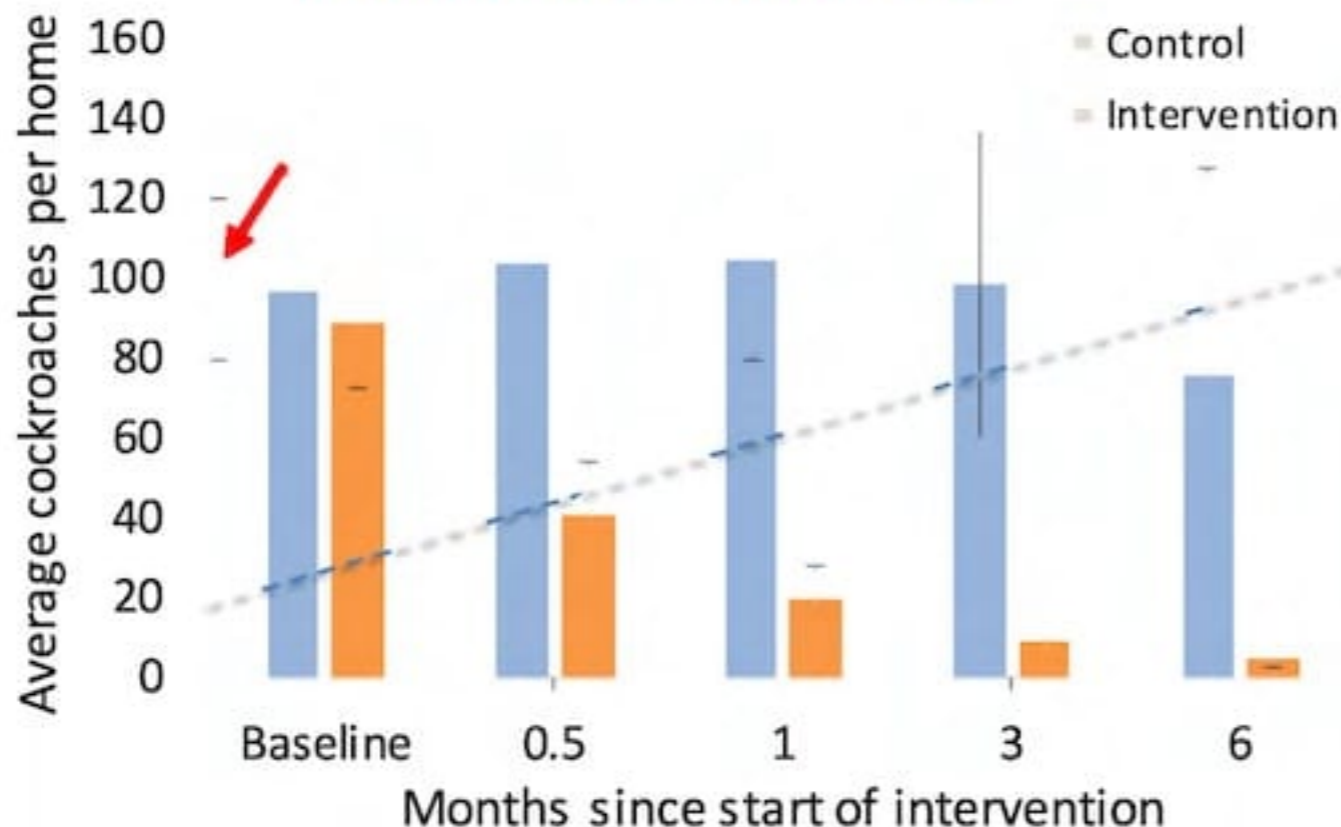

IPM

Baits

Conclusions

Cockroach control: **Baits**

- no change in untreated control homes
- Large cockroach reductions with baits

Cockroach control: **Endotoxins**

- no change in untreated control homes
- Large endotoxin reductions with baits

“Upside-Down Practical” IPM: Baits ONLY – Health outcomes

- Intervention homes had significantly **fewer** cockroaches than control homes
- Children in intervention homes had **fewer** asthma symptoms and **fewer** unscheduled health care utilizations in the previous 2 weeks
- Children in intervention homes had **better** pulmonary function than children living in control homes.

A single intervention for cockroach control reduces cockroach exposure and asthma morbidity in children

Felicia A. Rabito, PhD, MPH,^a John C. Carlson, MD, PhD,^b Hua He, PhD,^a Derek Werthmann, MPH,^a and Coby Schal, PhD^c *New Orleans, La, and Raleigh, NC*

Why do baits work so well?

1. Target all life stages (cf. mosquito)

2. Bioavailable Baits >>> Residual

Active ingredient	Bait	Fold AI needed to kil
Fipronil	Maxforce FC	550X
Indoxacarb	Advion	267X

Baits are highly efficacious – not rocket science!

- No fancy equipment needed
- Bait close to aggregations
- Near travel routes: structural edges, table legs, and electrical conduits
- Small dabs, not streaks, not caulking

Baits alone can **ELIMINATE** cockroach infestations and allergens
Baits effectively compete with household foods; but use more bait
Baits are more cost-effective than other strategies
Baits should always be the 1st step in residential interventions

Challenges with implementing bait interventions

- Perceived to be more expensive? **Not necessarily!**
- Thought to be more labor intensive? **Yes, but only early in the intervention!**
- Sanitation to eliminate food sources? **Yes, but usually over-stated**
- **Misapplication & misuse of bait**
- **Resistance**

Resistance: German cockroach

1. Physiological – to the insecticide

- Metabolic breakdown, excretion, sequestration
- Target site insensitivity
- Reduced penetration

2. Behavioral – to the insecticide or inert ingredients

- Movement away from treated surface
- No consumption of insecticide or inert ingredients

Resistance is pervasive!

IPM

Summary – Take-home points

Public health

– Beyond nuisance and aesthetics – cockroaches are significant public health pests (allergens, pathogens, contamination, insecticide residues)

– Most DIY approaches don't work!

IPM

– IPM has been broadly adopted by the clinical (asthma mitigation) community, but complex IPM is too expensive, unsustainable, ineffectual(?)

Baits

– Baits work extremely well, they are safe, placement is easy, they don't contaminate, highly bioavailable

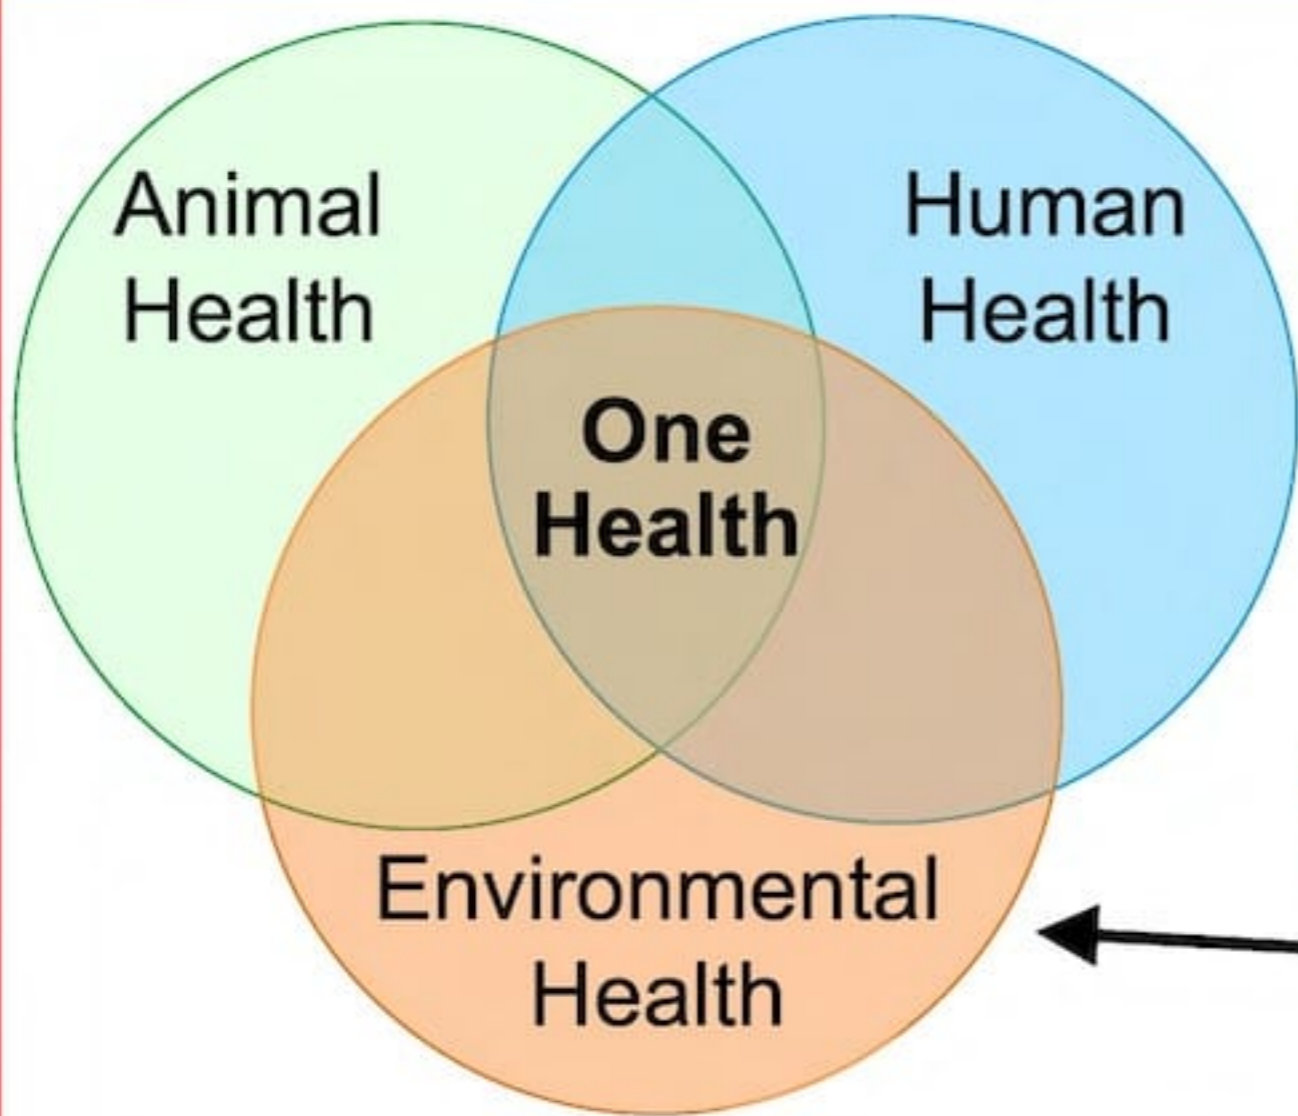

– Baits eliminate (not just reduce) infestations!

Conclusions

– Baits also face challenges: Aversion, resistance, misapplication, too little applied

– **Solution: Pay attention! Rotate bait products! Monitor!**
